

CEIS110

Programming with Data

Andrea Barber

Introduction

ONCE DATA IS COLLECTED IT
TYPICALLY REQUIRES
PROCESSING AND CLEANING TO
BE USEFUL

THIS PROJECT LEVERAGES CLOUD
TECHNOLOGY TO MONITOR
ENVIRONMENTAL CONDITIONS,
FOCUSING ON TEMPERATURE AND
HUMIDITY.

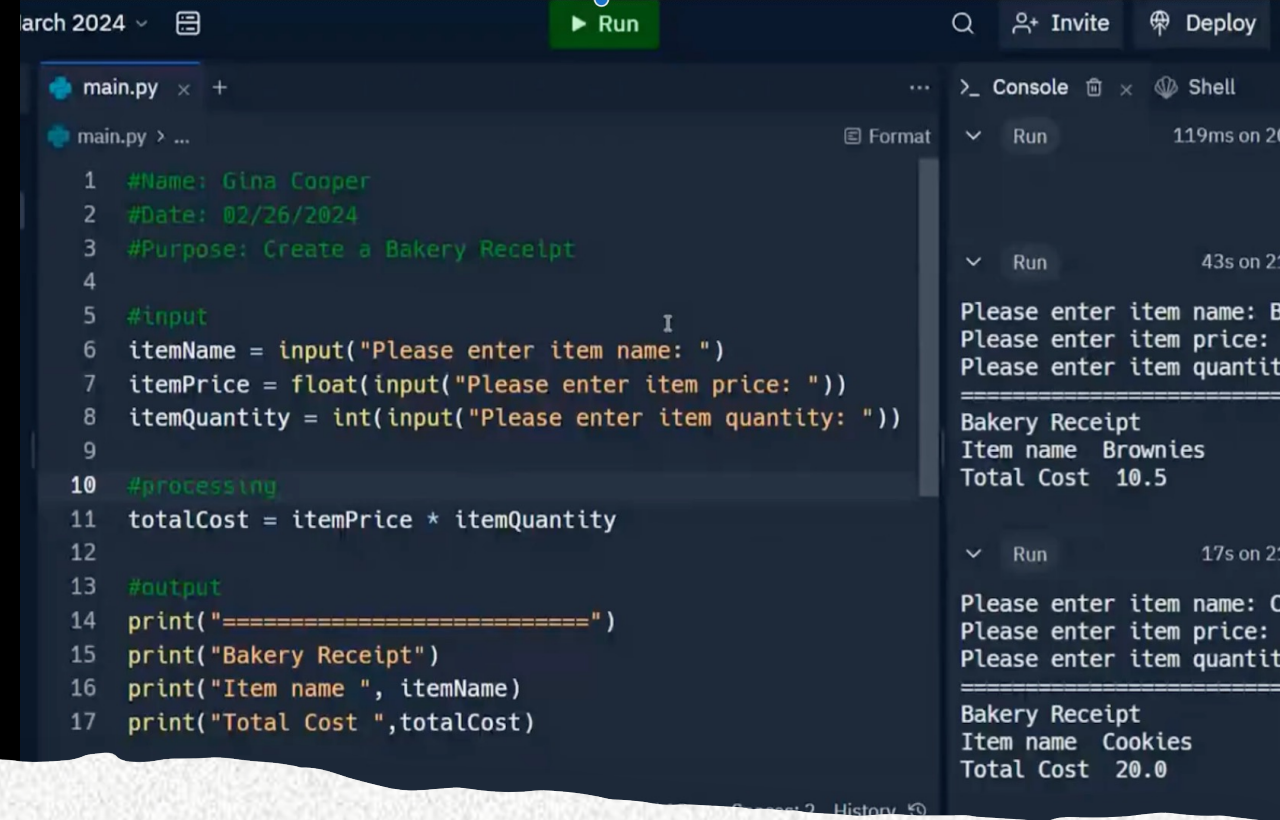

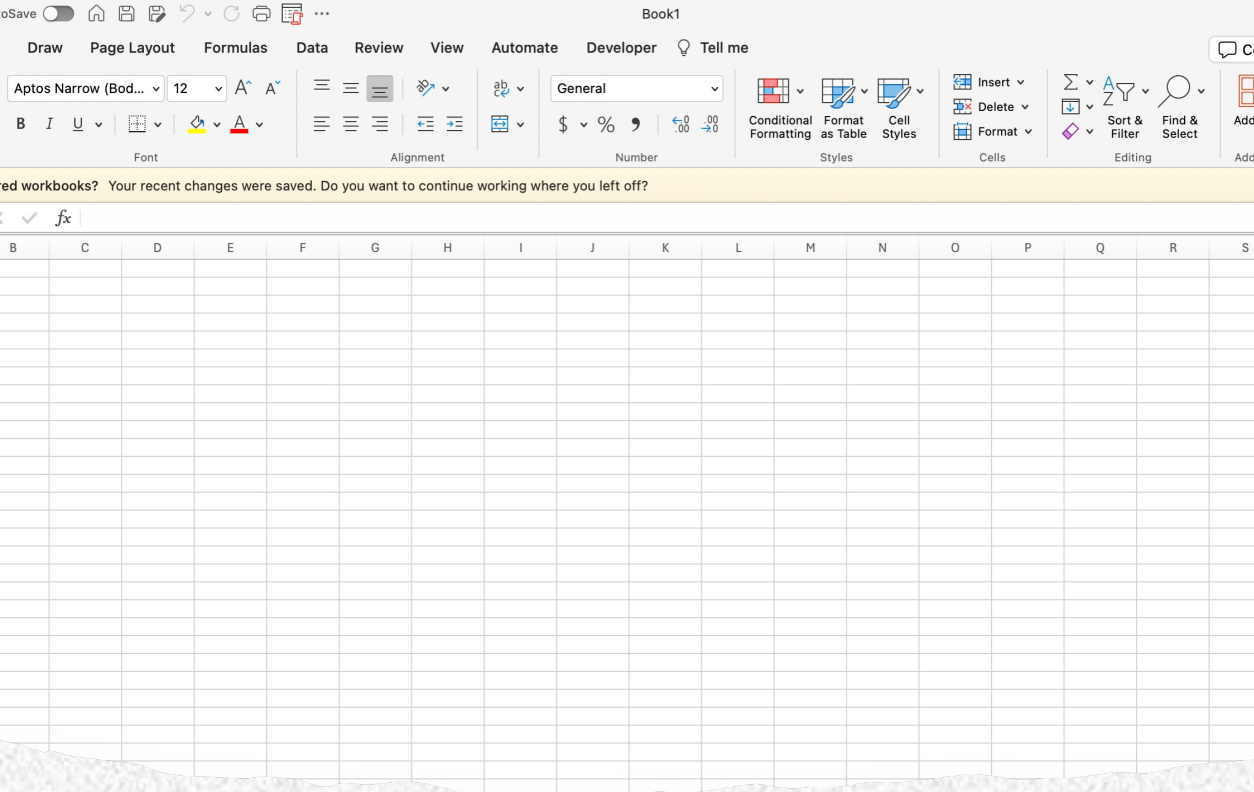

THE INFORMATION IS EXAMINED
THROUGH CODING AND DATA
ANALYSIS TECHNIQUES.

Software

Requirements

- The first requirement in developing a project is to install the correct programming language.
- One popular programming language that can be used is Python. However, an analyst may use programming software such as Replit or Microsoft Excel.

```
mirror_mod = modifier_ob.  
# Create mirror object to mirror_  
mirror_mod.mirror_object =  
_operation == "MIRROR_X":  
mirror_mod.use_x = True  
mirror_mod.use_y = False  
mirror_mod.use_z = False  
_operation == "MIRROR_Y":  
mirror_mod.use_x = False  
mirror_mod.use_y = True  
mirror_mod.use_z = False  
_operation == "MIRROR_Z":  
mirror_mod.use_x = False  
mirror_mod.use_y = False  
mirror_mod.use_z = True  
  
#selection at the end -add  
mirror_ob.select= 1  
modifier_ob.select=1  
context.scene.objects.active  
("Selected" + str(modifier_  
mirror_ob.select = 0  
= bpy.context.selected_obj  
data.objects[one.name].select  
  
print("please select exactly  
----- OPERATOR CLASSES -----  
  
types.Operator):  
X mirror to the selected  
object.mirror_mirror_x"  
mirror X"  
  
context):  
active_object is not
```

Software

The software required for the project includes Microsoft Excel and Replit.

Planning and Design

- Following a review of the required programs for the project, a strategy was devised for the temperature data initiative.
 - To outline the project structure a flowchart was created.
 - The blueprint and configuration of the project are essential phases for comprehending the progression framework.
-

What are Flowcharts?

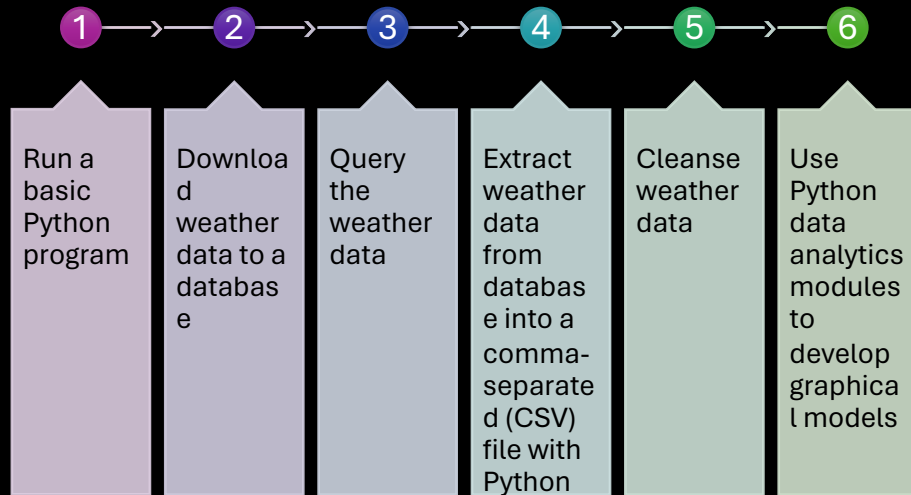

A Flowchart consists of standard geometric symbols that graphically indicate the actions to be executed and the exact order in which those actions should be executed

Flowcharts help companies visualize the steps involved in processing data from input to output.

Flowchart steps

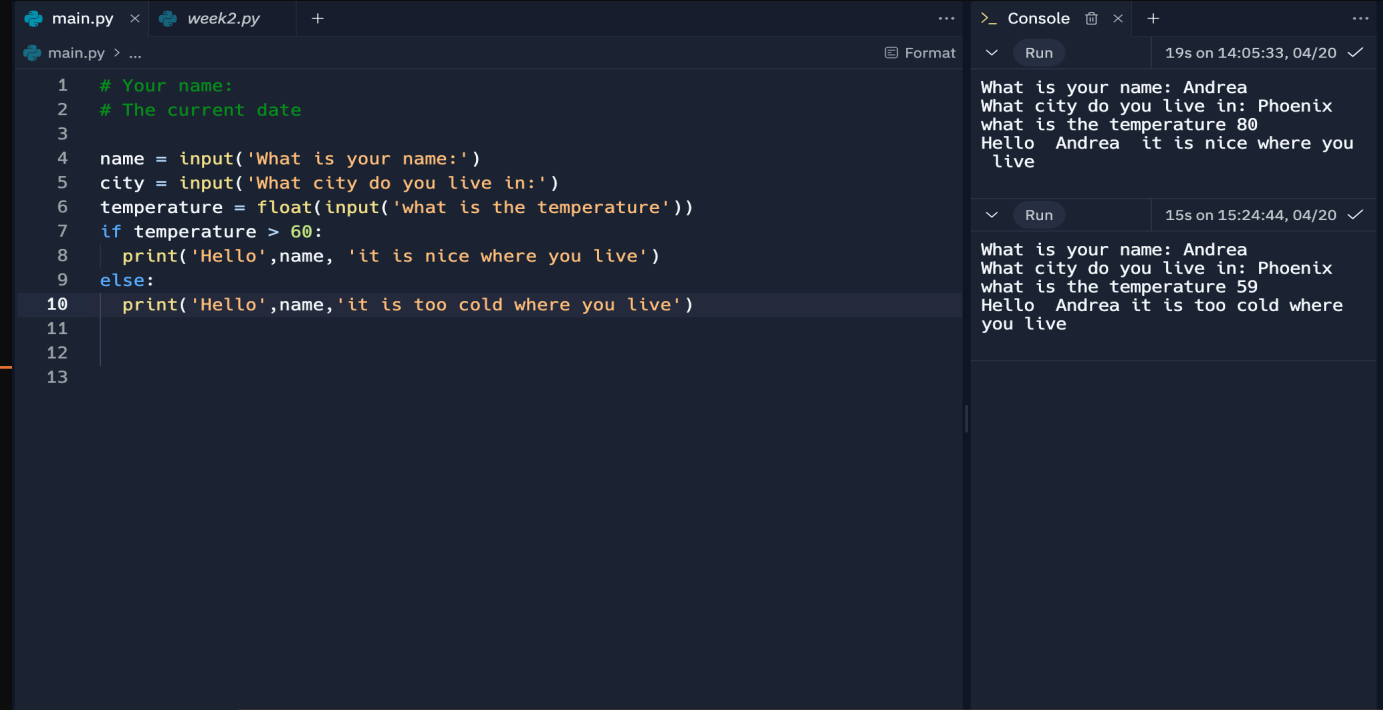

Introduction to Python

To write a program in Python you need an integrated development environment also known as an IDE.

Python combines an editor, debugger, and programming aid in one package.

Spyder, Visual Studio Code, Pycharm, and other tools are also available.

The screenshot shows a Python IDE with two tabs: 'main.py' and 'week2.py'. The code in 'main.py' is as follows:

```
1 # Your name:
2 # The current date
3
4 name = input('What is your name:')
5 city = input('What city do you live in:')
6 temperature = float(input('what is the temperature'))
7 if temperature > 60:
8     print('Hello',name, 'it is nice where you live')
9 else:
10    print('Hello',name,'it is too cold where you live')
11
12
13
```

The console shows two runs of the program. The first run, at 14:05:33, shows the user inputting 'Andrea', 'Phoenix', and '80', resulting in the output: 'Hello Andrea it is nice where you live'. The second run, at 15:24:44, shows the user inputting 'Andrea', 'Phoenix', and '59', resulting in the output: 'Hello Andrea it is too cold where you live'.

Gathering Temperature and Humidity data

- Following the strategy and blueprinting phase, the program was created to retrieve a collection of weather data.
- The information was saved in a nearby data repository in a tabular format for subsequent examination in Replit.

BuildWeatherDb.py Code (Screenshot)

An image capture
of the code in
Replit

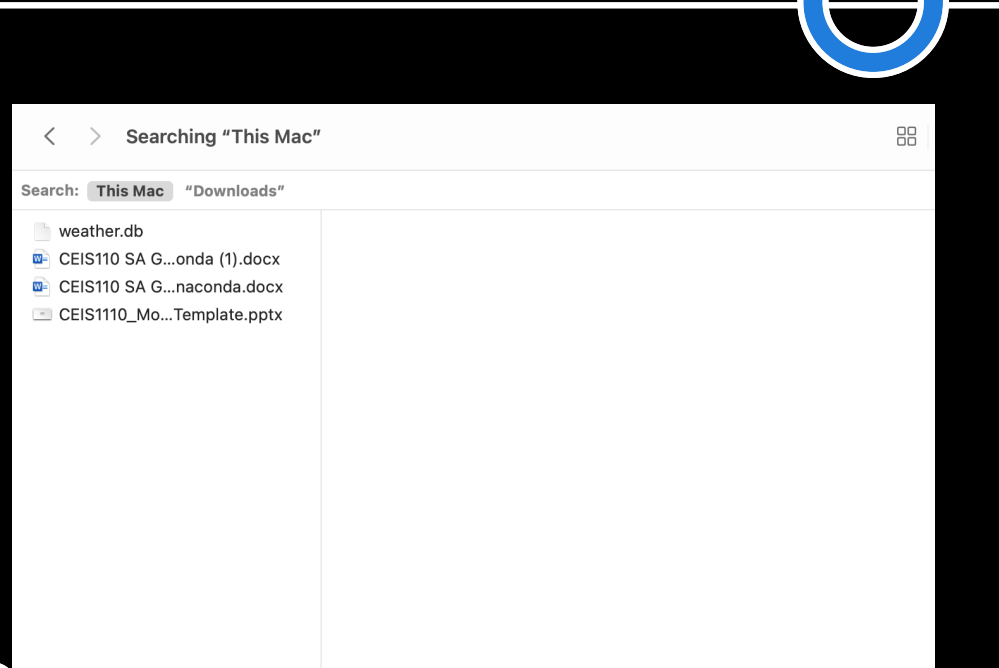

The code will
create a table
named
observations with
the following
fields: timestamp,
windspeed,
temperature,
relativehumidity,
windDirection,
barometricpressur
e, visibility and
textDirection.

The database will
be called
"weather.db" and
placed in the same
folder as the Replit
repository. script.

```
1  # -*- coding: utf-8 -*-
2  """
3  Spyder Editor
4
5  This is a temporary script file.

8  #Purpose: Build weather database from NOAA data
9  #Name: Andrea Barber
10 #Date: 3/13/2024
11 # See https://pypi.org/project/noaa-sdk/ for details on noaa_sdk package used
12
13 from noaa_sdk import noaa
14 import sqlite3
15 import datetime
16
17 # parameters for retrieving NOAA weather data
18 zipCode = "15201" # change to your postal code
19 country = "US"
20 #date-time format is yyyy-mm-ddTth:mm:ssZ, times are Zulu time (GMT)
21 #gets the most recent 14 days of data
22 today = datetime.datetime.now()
23 past = today - datetime.timedelta(days=14)
24 startDate = past.strftime("%Y-%m-%dT00:00:00Z")
25 endDate = today.strftime("%Y-%m-%dT23:59:59Z")
26
27 #create connection - this creates database if not exist
28 print("Preparing database..")
29 dbFile = "weather.db"
30 conn = sqlite3.connect(dbFile)
31 #create cursor to execute SQL commands
32 cur = conn.cursor()
33
34 #drop previous version of table if any so we start fresh each time
35 dropTableCmd = "DROP TABLE IF EXISTS observations;"
36 cur.execute(dropTableCmd)
37
38 #create new table to store observations
39 createTableCmd = """ CREATE TABLE IF NOT EXISTS observations (
40     timestamp TEXT NOT NULL PRIMARY KEY,
41     windSpeed REAL,
42     temperature REAL,
43     relativeHumidity REAL,
44     windDirection INTEGER,
45     barometricPressure INTEGER,
46     visibility INTEGER,
47     textDescription TEXT
48 ); """
49 cur.execute(createTableCmd)
50 print("Database prepared")
51
52 # Get hourly weather observations from NOAA Weather Service API
53 print("Getting weather data..")
54 n = noaa.NOAA()
55 observations = n.get_observations(zipCode, country, startDate, endDate)
```

Weather.db File (Screenshot)

Screenshot of Filepath way on Mac OS showing database file Weather.db was created

Querying the Database

- Structure Query Language(SQL) is a specialized programming language for working with a relational database.
- Programs written in a general-purpose programming language like Python, issue SQL commands to the database “under the hood” and receive and display the results to the user.

```
1 #Purpose: Query database using SQL
2 #Name: Andrea Barber
3 #Date: 03/21/2024
4 # Run BuildWeatherDB.py to build weather database before
  running this program
5
6 import sqlite3
7 import pandas as pd
8
9
10 #file names for database and output file
11 dbFile = "weather.db"
12
13 #format output
14 pd.set_option('display.max_rows', None)
15 pd.set_option('display.max_columns', None)
16 pd.set_option('display.width', None)
17 pd.set_option('display.max_colwidth', None)
18 pd.set_option('display.expand_frame_repr', False)
19
20 #connect to and query weather database
21 conn = sqlite3.connect(dbFile)
22 #Create SQL command
23 selectCmd = " SELECT * FROM observations ORDER BY timestamp; "
24
25
26 #print out the query
27 result = pd.read_sql_query(selectCmd, conn)
28 print(result)
29
```

Package operations: 0 installs, 0 updates, 0 removals

- Installing six (1.16.0)
- Installing numpy (1.26.4)
- Installing python-dateutil (2.9.0.post0)
- Installing pytz (2024.1)
- Installing tzdata (2024.1)
- Installing pandas (2.2.1)

Query to retrieve the data when the weather is clear (Screenshot)

A different request was made to obtain the temperature, wind speed, and text description when the weather is clear

Data cleansing

- When processing data from machines, inaccuracies or irrelevant information may occur. Data-cleaning tools can automatically convert the information into the correct format for other applications to use.
- A Python script is processing the data generated by the code and storing it in a CSV file for Excel compatibility.
- Data frequently requires cleaning to remove errors or fill in gaps. It must be accurate, consistent, and uniform.

```
mirror_mod = modifier_ob.  
set mirror object to mirror.  
mirror_mod.mirror_object =  
operation == "MIRROR_X":  
mirror_mod.use_x = True  
mirror_mod.use_y = False  
mirror_mod.use_z = False  
operation == "MIRROR_Y":  
mirror_mod.use_x = False  
mirror_mod.use_y = True  
mirror_mod.use_z = False  
operation == "MIRROR_Z":  
mirror_mod.use_x = False  
mirror_mod.use_y = False  
mirror_mod.use_z = True
```

Extracting Temperature and Humidity using Python code

- The weather.db data repository might include empty or absent records. The script extracts just the temperature and humidity readings and exports them to a CSV file. Two separate files are generated, formatdata1.csv and formatdata2.csv, each holding half of the rows. Absent and incorrect values are also logged in the output.

Data Formatted in an Microsoft Excel Spreadsheet

- The Python program created a formatdata1.csv file
- This contains 3 columns: Celsius, Fahrenheit, and Humidity
- Statistics can be performed on this spreadsheet

Data Visualization

A Line chart was created in Microsoft Excel showing the Temperature and Humidity over Period 1.

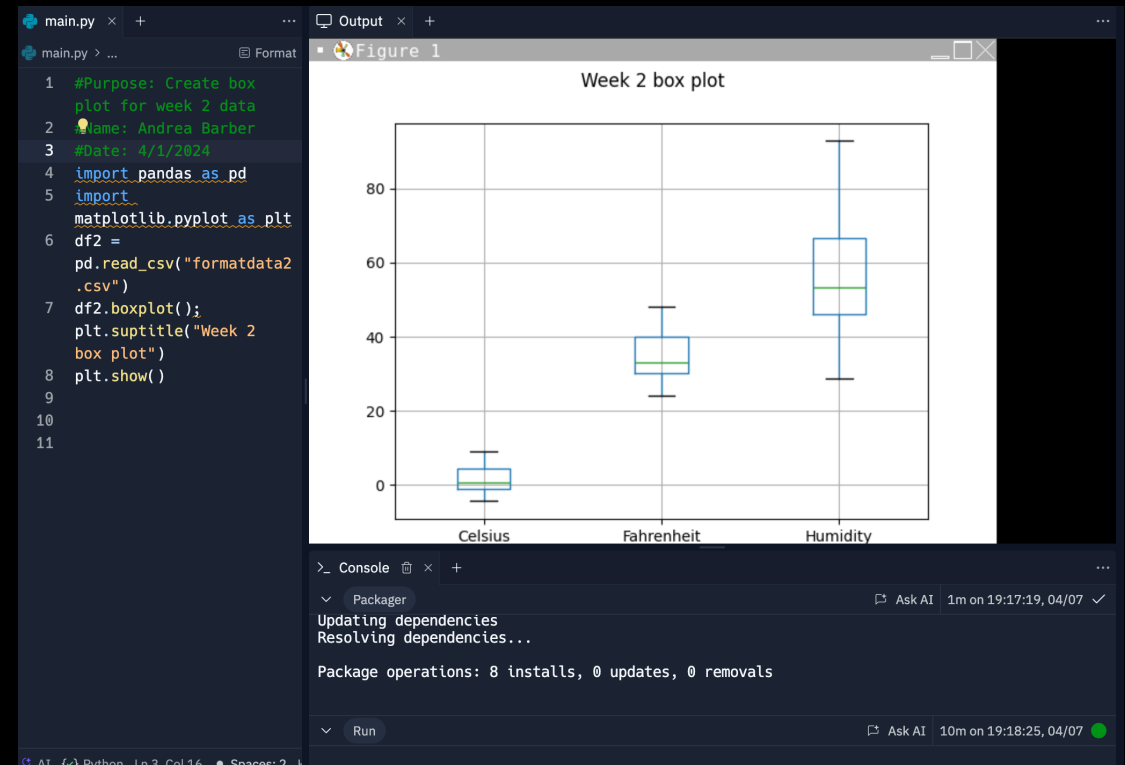

Data Analytics

- Python data analysis packages enable users to create visual representations, like charts and graphs, to illustrate data
- The dataset can also be modified and stored in a table-like structure
- The data analysis components are accessible through Replit
- Multiple graphs were created to examine temperature and humidity
- Subsequent forecasts were derived from the collected information

Histogram of Humidity

- #Purpose: Create a histogram of humidity data from the second period
 - #Name: Andrea Barber
 - #Date 4/7/2024
 - Import pandas as pd
 - Import matplotlib.pyplot as plt
- Df2= pd.read_csv("formatdata2.csv")
- Df2.boxplot();plt.suptitle("Period 2 box plot")
 - plt.show()
 - Print(df2.info())
 - Print(df2.describe())
- Print("The Median is", df2.median())

Analysis

- The following phase in the examination involved formulating a query and utilizing the information presented in the graphs to address it.
- My Question: What is the impact of rising temperatures on the dew point and relative humidity?
- Two graphs were generated to display the temperature in Fahrenheit and humidity levels, using information collected during the first two weeks.
- Answer supported by Chart:
 - As humidity peaks, the dew point does not necessarily increase, which could be attributed to temperature changes affecting the air's capacity to hold moisture.

Code

The code to create the Fahrenheit plot is below:

```
import pandas as pd
import matplotlib.pyplot as plt
Df2= pd.read_csv("formatdata1.csv")
Df2= pd.read_csv("formatdata2.csv")
plt.figure();df2.Fahrenheit.plot(label='Fahrenheit');df2.Humidity.plot(label = "Humidity"),
plt.legend(loc='best');plt.subtitle('Trail 2 – Temperature vs Humidity')
plt.show()
```

Prediction

if the temperature starts to climb, expect the humidity to drop, since warm air can hold more water. But if it cools down, the humidity will go up, and we might even see some dew on the grass or fog over the fields over the next few weeks.

Challenges

- When creating the Python program it needed to be in the same repository.
 - Misspelling certain words in for the library install

Career Skills

- Using flowcharts to plan project
 - Database development
- Troubleshooting errors in the code and data cleansing
 - Programming using Python
- Analysis by creating and reviewing charts and graphs to make predictions using data acquired

Conclusion

- This project explored the core concepts of coding with data by utilizing information collected from the cloud platform to facilitate data analysis tasks
- Creating this project offered a practical learning experience to apply the concepts and abilities explored this semester
